

About this page:

Achieving emission reductions in line with the 1.5 degree towards net-zero emissions by 2050 is not an aspirational goal but a necessary commitment. Investors and businesses worldwide must integrate climate considerations into their decision-making processes to help transform economic sectors to ensure financial resilience and long-term value creation while addressing climate risks and opportunities.

Net Zero Target Setting Guidance

The net zero target setting guidance provides fund managers with the tools and frameworks needed to set credible, science-aligned net-zero targets, outlining key frameworks such as the Science-Based Targets Initiative (SBTi), the Net-Zero Investment Framework (NZIF), and guidance from the Glasgow Financial Alliance for Net Zero (GFANZ). It is designed for fund managers operating in emerging markets, where regulatory and operational challenges can make net-zero alignment particularly complex.

GHG Accounting tool

The GHG Accounting Tool is a practical resource developed to support fund managers in accurately measuring, managing, and reporting greenhouse gas (GHG) emissions across their investment portfolios. It enables the calculation of both absolute emissions (total emissions produced) and emissions intensity (emissions relative to financial or operational metrics), offering a flexible framework to suit different portfolio structures and asset types. By aligning with the internationally recognized Greenhouse Gas (GHG) Protocol, the tool ensures consistent coverage of Scope 1 (direct), Scope 2 (indirect from purchased energy), and, where feasible, Scope 3 (indirect from value chain) emissions, facilitating harmonized reporting across industries.
